KEWANEE®

more engineering

more material and labor

more experience

make the difference

more engineering: From the design stage, right through to the finished product, the skill and experience of Kewanee engineers is applied continually. First in the designing and proper proportioning of boilers to assure maximum steam production . . . then studying each step of their manufacture . . . and finally in numerous tests of the finished product to make certain it performs as planned.

more material goes into Kewanees to insure extra strength and the generous sizing of all parts that equips them to handle large overloads with efficiency. Even the Kewanee Boilers of compact design . . . intended for use when less floor space or head room is available . . . are never skimped in materials or measurements hence operate at full efficiency throughout their entire firing range.

more labor is put into Kewanees. Notice the smooth riveting, the carefully welded seams, the fine finish of all cast parts! This requires more labor but it *puts something extra* into the boilers that reflects quality.

more experience: Over 85 years of boiler building experience can't be matched by guesswork. When a Kewanee goes onto a job the owner gets all the "know how" Kewanee has accumulated during many years of fabricating boilers of steel.

These are things . . . some of them intangible . . . which make Kewanee Boilers different and better.

nationwide representation: There is a Kewanee representative as near as your telephone and every branch is staffed with men who know boilers and the many problems of generating steam. They are anxious to serve you. See back cover for listing of branch offices.

500 Series . . . heavy duty

15 sizes . . . 30 to 304 hp
125 and 150 lb swp

for heavy-duty service . . . providing heat for large apartments, schools, hospitals, office buildings and factories, or for power or process steam . . . Kewanee "500" is a real giant. It is strong, dependable and very efficient. A two-pass firebox type, it is the design which made the name Kewanee famous.

From top to bottom and from front to rear it is built with just one idea . . . to make it the most efficient, dependable and long lived boiler that can be constructed.

Big high fireboxes provide plenty of space and air for the fuel to combine with oxygen and burn, completing the process of combustion before the gases reach the return tubes. In the long travel of the hot gases through the firebox and the lower tubes, then through the upper tubes to the exit chamber, all usable heat is transferred to the boiler's water.

Water surrounds both upper and lower banks of tubes and all sides and top of the fire chamber so the transfer of heat is rapid and certain. Waterways are free of obstructions promoting rapid rise of the steam bubbles to the steam disengaging area and into the capacious steam chamber at the top of the boiler.

The use of 3 inch tubes permits more tubes and more heating surface further helping make the "500" a very fast and efficient steamer. And this efficiency is maintained even when the boiler is pushed to produce 50%, and more steam than is guaranteed by its rated capacity.

Both banks of tubes are easily accessible through the large doors at front and rear . . . manholes and hand holes provide access to the waterways.

Specifications and data are shown for mechanically-fired boilers. For information regarding hand-fired coal types consult the nearest Kewanee representative.

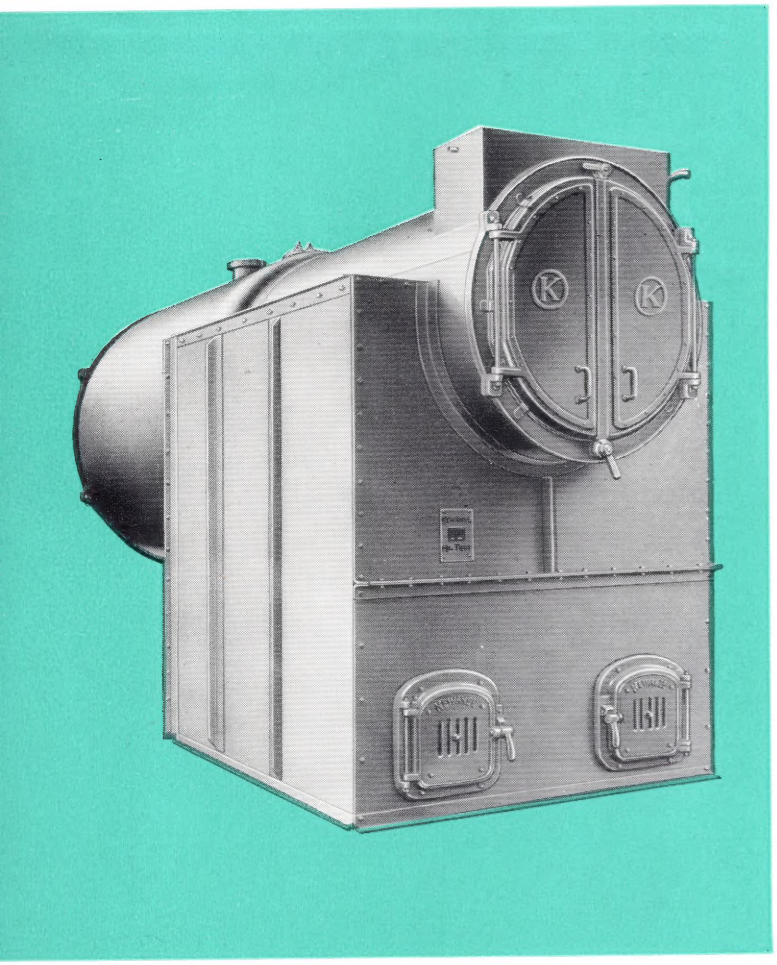
KEWANEE®



Hi-Test for power or industrial process steam

8 sizes . . . 61 to 304 hp
125 and 150 lb swp

The Kewanee Hi-Test Series is an excellent example of a modern all weld boiler. With fusion electric welding, joints of unquestioned strength are obtained, then X-Ray checked to be certain that the seams are perfect. The entire boiler is then placed in a huge Stress Relieving Furnace where the joints are thoroughly annealed then allowed to cool gradually, eliminating any possibility of locked-up stresses. This is the Number 1 Weld procedure followed in all welded Kewanees for high pressure.

The finished boiler is further subjected to hydrostatic test pressures equal to one and one-half times its allowable working pressure, in accordance with ASME Code requirements. Each boiler is rigidly inspected . . . during construction and when completed . . . by a qualified inspector licensed by the National Board of Boiler and Pressure Vessel Inspectors to insure acceptance by any state or municipality.

Kewanee Hi-Test is simple in design. Two cylindrical shells of different diameters are joined with tube heads, with only a few diagonal head braces needed. The front and rear flue gas chambers are an integral part of the boiler shell, eliminating joints.

The metal casing on the front of the boiler, which forms the fire chamber, is designed for a refractory lining (not furnished as part of the boiler), making it entirely self-contained.

Hi-Test Kewanee may be fired from the front or rear . . . with all fuels. For information on the Hi-Test for hand-firing, consult your local Kewanee representative.

Specifications and data are shown for mechanically-fired boilers. For information regarding hand-fired coal types consult the nearest Kewanee representative.

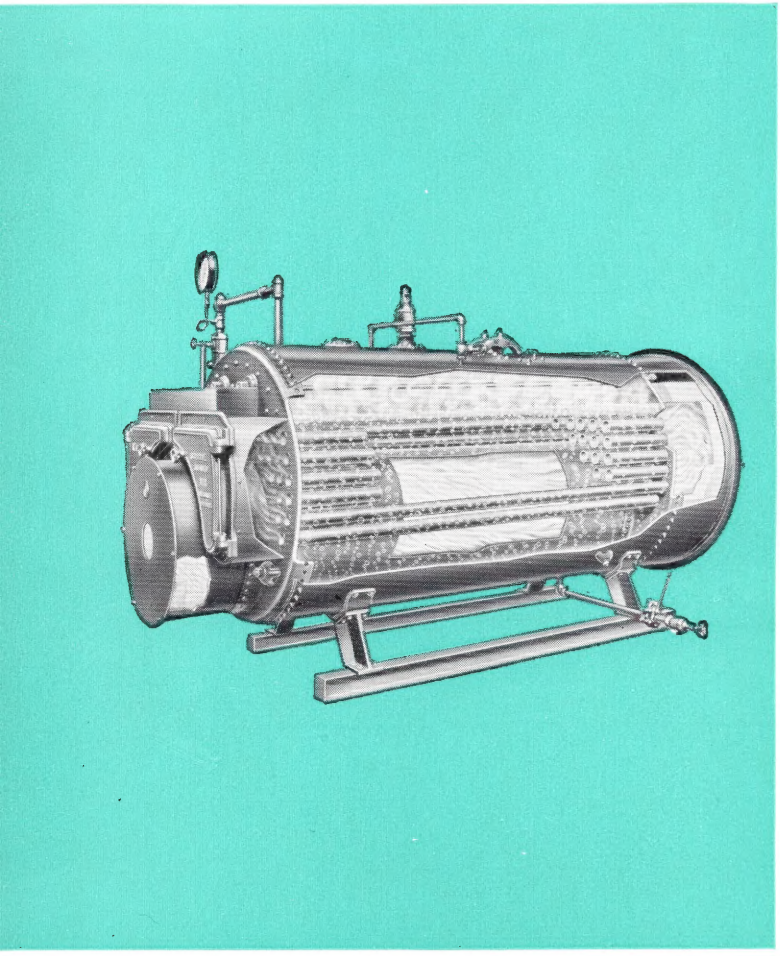
KEWANEE®



Scottie Junior

6 sizes . . . 7 to 36 hp . . . 125 lb swp

Originally designed for ships with limited space and head room, Kewanee Scotch type boilers provide the solution for many power and industrial process steam problems.

Shell of flange quality steel with a tensile strength of 55,000 to 65,000 pounds per square inch. Longitudinal joint is riveted with double butt strap construction. Girth seams are riveted and caulked tight around the shell edges and at each end of the welded furnace. Solid through-stays complete front to rear bracing.

Rear combustion chamber . . . with high temperature refractory lining installed at the factory.

Long gas travel to the rear through the furnace . . . then to the front through heavy 12 gage 3″ fire tubes . . . transfers all usable heat to the water.

Longer furnace creates ideal flame conditions for automatic firing with any standard gun-type burner.

Mounted on skids . . . Scottie Jr. arrives mounted on substantial wood skids. No foundation is needed. Steel skids available at extra cost.

Heads, hot flanged of firebox quality steel and tube holes trepanned from solid plate.

Heavy cast iron doors precision ground for gas tight fit. Heavily insulated to prevent warping.

Threaded flange steam outlet assures tight fitting, trouble-proof connection with steam mains.

Large steam space assures ample reserve of steam. Unobstructed disengaging area at water line keeps the steam dry.

* Fuel burning rates based on 150,000 Btu oil.

Standard equipment (15-125-150 lb steam)—Steel saddle supports, refractory lined rear combustion chamber factory installed. Flue cleaner and handle. Washout plug socket wrench for 15 lb boilers only.

Standard trim (15-125-150 lb steam)—Safety valve(s) as required by ASME Code, steam gage with siphon and cock, water column with water-gage glass and three gage cocks. Chain operated water gage valves and try cocks with boilers HM-884, LM-884 and larger.

Note—For 125 and 150 lb steam boilers: Globe and check valves for feed line, quick action and slow action blow-off valves ae furnished.

Standard equipment (water boilers)—Steel saddle supports, refractory lined rear combustion chamber factory installed. Flue cleaner and handle. Washout plug socket wrench.

Standard trim (water boilers)—None furnished.
Additional equipment or trim at extra cost.

M-800 series

- **high pressure units . . . 39 to 304 hp . . . 125 and 150 psi**
- **low pressure units . . . 15 psi steam or 30 psi water . . . 1,313,000 to 10,200,000 Btu**

The Scotch type Kewanee M-800 is decidedly Scotch in its ruggedness and extreme thriftiness when it comes to producing steam economically. Designed and built to generate steam with efficiency through its entire firing range, it can be pushed far above its rated capacity without interrupting its usual economical operation.

The M-800 is designed on 8.2 square feet of heating surface for each horsepower of its rated capacity. This proper proportioning of primary and secondary heating surfaces to the volume of water in the boiler comes only as a result of many years of experience and continual testing to find out just what is right.

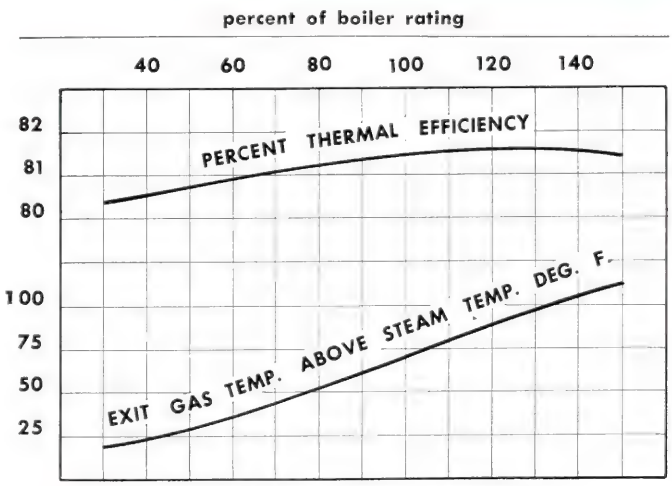
1. **Shell** is shaped from heavy flange steel with heads and furnace of firebox quality. All welds in accordance with ASME Code. Boilers for 125 and 150 psi stress relieved.
2. **Large steam chamber** provides reserve for emergency demands.
3. **Unbroken steam disengaging area** permits steam to rise without undue turbulence.
4. **11 x 15 in. manhole** and washout openings give access to waterside.
5. **Corrugated furnace** for extra strength and added heating surface next to the fire. Its generous size provides plenty of space for the burning fuel to mix with the air and burn completely. Low pressure boilers provided with plain circular furnace.
6. **Heavy gage 3 in. tubes** expanded into holes with ends firmly rolled and beaded.
7. **Rear combustion chamber** is heavily lined with refractory. Boilers for high pressure incorporate dry back design. Low pressure boilers designed with water back top. Sectional rear cover plate with observation port and access opening to fusible plug.
8. **Sturdy steel saddle supports** simplify handling and installation. No special base is required.
9. **Long gas travel** the length of the fire chamber and into the rear combustion chamber then forward through the long tubes gives the water in the boiler a chance to absorb all the heat . . . stepping up the transfer of heat without wasting it.
10. **Rapid circulation** through the unobstructed waterways speedily sweeps the steam bubbles up without commotion . . . an important factor in making M-800 a fast steamer.
11. **Substantial hinged flue doors,** gasketed for permanent gas-tight fit. Provide easy access to fire tubes for cleaning and inspection.
12. **Gas tight smokebox** of heavy gage steel . . . welded in one piece to boiler shell. Rectangular smoke outlet located at top.

certified high efficiency

Teamed with any good oil, gas or combination oil-gas burner, Kewanee M-800 performs "on the job" with overall efficiencies of 80% and more. And this efficiency remains practically constant whether the boiler is being operated at 50% or 150% of its rated capacity.

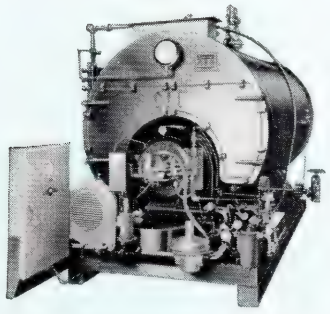
Such efficiency figures are confirmed by certified performance tests in which the total amount of the heat in the oil or gas put into the burner and the amount of water evaporated into steam are carefully measured and converted into a figure showing the overall operating efficiency.

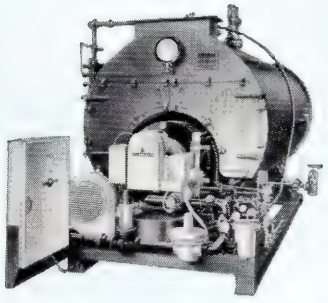
A chart of typical boiler performance appears at the right.

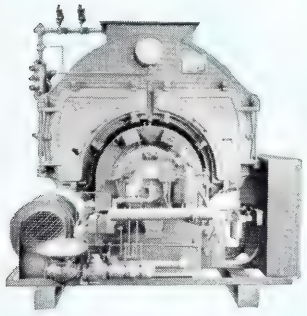


typical boiler performance

KEWANEE®







M-800 series

. . . a great teammate for any quality oil, gas or combination oil-gas burner

The Kewanee M-800 Boiler is ideal for use with any quality oil, gas or combination oil-gas burner to form a complete Boiler-Burner Unit.

A few of the many features which make this boiler so adaptable to Boiler-Burner Units are . . .

- complete range of sizes for both high and low pressures
- unusual strength and dependability
- ability to produce far above rated capacities at highest efficiencies
- greater heating surface
- ease of cleaning and inspection
- steel skids that eliminate special base construction
- only two or three matching connections to make in mounting burners to boiler frame

Three Boiler Burner Units developed using the M-800 Series are shown at left. For additional information on these units, write for separate catalogs.

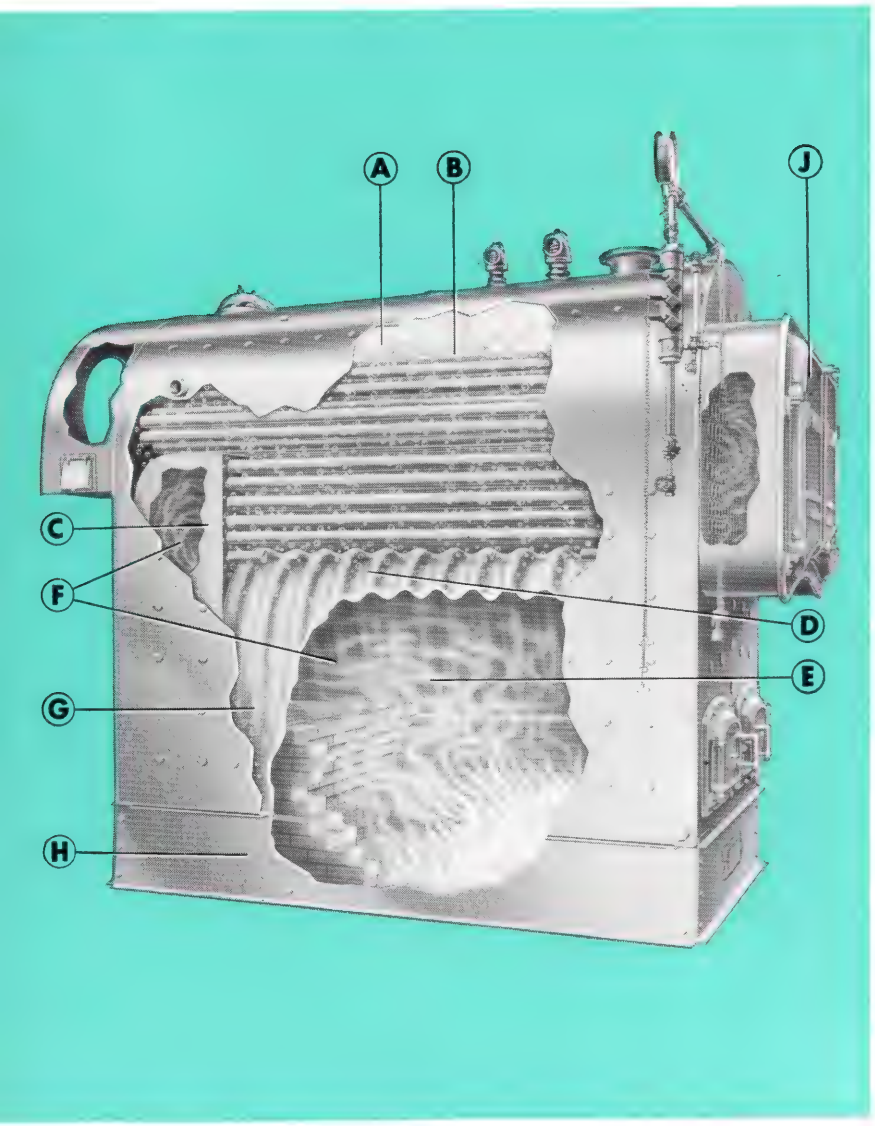
KEWANEE®



type "C" 15 psi steam or 30 psi water
1,750,000 to 10,200,000 Btu

Kewanee Type "C", with its corrugated Crown Sheet, has become America's most popular boiler for heating large buildings. It fills a definite need for a completely dependable, fast-steaming boiler designed for restricted space. The following features tell why.

A **Capacious steam space** provides room for large reserve.

B **Expansive steam disengaging area** is unbroken, eliminating turbulence at the water line and keeping wet steam from the mains.

C **Rear combustion chamber,** an integral part of the firebox, converts any unburned fuel into heat before reaching firetubes.

D **Crown sheet** of heavy flange steel is formed with massive corrugations, adding strength and practically doubling the heating surface over the hottest part of the fire.

E **Wider, higher combustion chamber** provides sufficient air and space to completely burn all the fuel.

F **Long gas travel** through the firebox and rear combustion chamber then forward through the lower tubes then again to the rear through the upper tubes, holds the gases in the boiler until all usable heat is picked up by the boiler's water.

G **Rapid circulation** of water up from the large water legs at sides, front and rear and between the widely spaced firetubes, prevents sediment from lodging and permits steam bubbles to be swept up quickly . . . an important factor that makes the Type "C" a very quick "steamer."

H **Heavy steel base** assembled with 4 staunch cast iron posts.

J **Cast doors** are extra heavy, and insulated to keep heat inside the boiler.

Specifications and data are shown for mechanically-fired boilers. For information regarding hand-fired coal types consult the nearest Kewanee representative.

KEWANEE®

5000 series

15 psi steam or 30 psi water

15 sizes . . . 1,020,000 to 10,200,000 Btu

The Kewanee "5000" low pressure series is rapidly growing in popularity for heating large buildings when specifications or restricted budgets require an economical boiler of unquestioned durability and efficiency.

"5000" is an electric welded series, in the fabrication of which all modern practices and improvements in welding have been combined to produce a completely dependable product . . . a boiler worthy of the name Kewanee.

In design the "5000" is similar to that of the famous heavy-duty Kewanee "500" and has all those outstanding characteristics which for some 85 years have made Kewanee Boilers different and better.

Extra large and *extra high fireboxes* provide ample space and air in which the burning fuel can mix with oxygen to complete the combustion process without waste of fuel. *Longer travel of gases* . . . from the fire chamber through the lower bank of tubes then through the upper tubes to the exit chamber at the front . . . gives the boiler's water a chance to absorb and use all the heat that is created in the firebox.

Circulation is rapid through generously sized water legs and between the well-spaced fire tubes, sweeping the myriad of steam bubbles up into the capacious steam chamber without undue commotion. The disengaging areas at the water line are unbroken insuring a constant supply of dry steam.

As is true with all Kewanee Boilers the "5000" can be fired to produce 50% and more than its rated capacity and continue to operate at full efficiency.

Specifications and data are shown for mechanically-fired boilers. For information regarding hand-fired coal types consult the nearest Kewanee representative.

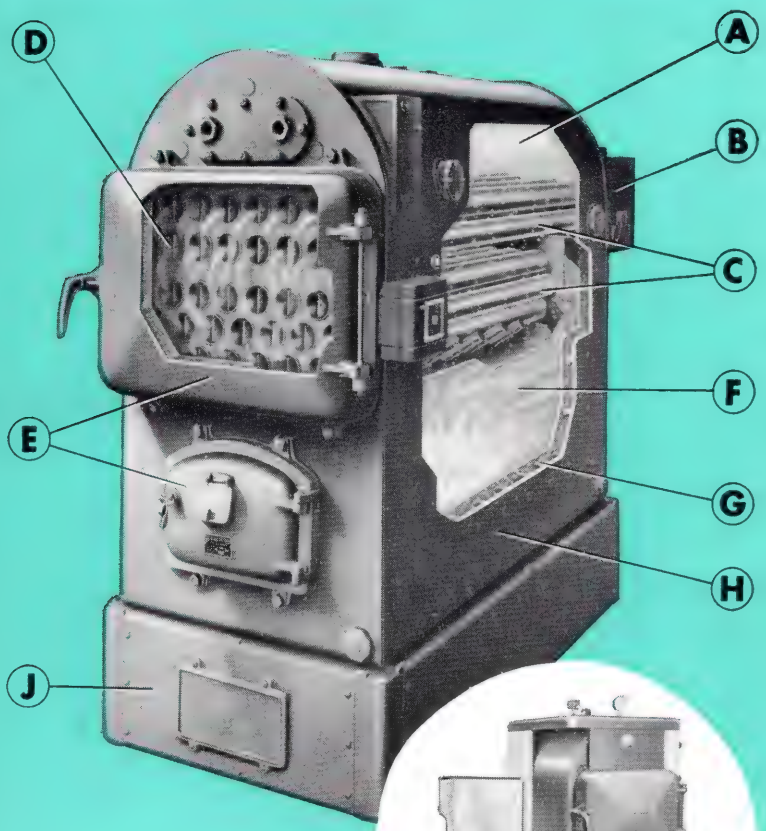
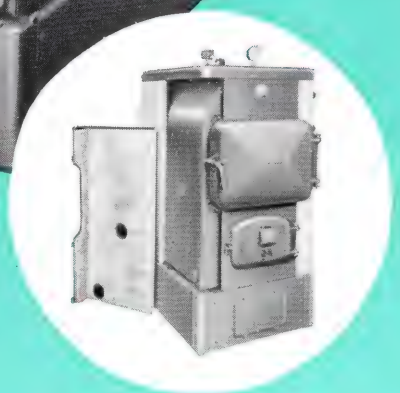
KEWANEE®





Available with attractive steel insulated jacket. Quickly installed on a new boiler or on one already installed without removing boiler from its base.

Square-Heat type "R" boiler

12 sizes . . . 216,000 to 1,200,000 Btu
900 to 5000 sq ft steam
1440 to 8000 sq ft water

Never before has a boiler been built with the versatility of Kewanee Square-Heat. It is ideal for medium size buildings of all types or for small factories. It burns any fuel and a change from one to another, or from mechanical to hand firing, or back again, can be made quickly and inexpensively.

These features indicate why Square-Heat packs so much heat generating ability in comparatively small space.

A **Large, high steam space** assures ample reserve of dry steam.

B **Reversible smoke box** may be used with either top or rear smoke outlet.

C **Longer gas travel** . . . to the rear, then to the front, and to the rear again gets all the heat into the boiler's water.

D **Spinner blades** in oil or gas boilers (3R1 to 8) swirl hot gases against tube walls assuring maximum heat transfer.

E **Insulated, sturdy cast doors** are precision ground for permanent gas tight fit. Observation opening has adjustable hinged cover for secondary overfire air.

F **Large, high firebox** provides ample space and air for complete, economical burning of the fuel.

G **Rapid circulation** in wide free waterways sweeps steam bubbles up, without commotion, to unbroken release area at water line.

H **Shell** of extra heavy high quality steel adds strength.

J **Extra substantial steel base** can be reversed for firing from rear.

Extra high bases (20 and 30 in.) for mechanical firing instead of standard 14 in. base are available, if specified, at extra cost.

Specifications and data are shown for mechanically-fired boilers. For information regarding hand-fired coal types consult the nearest Kewanee representative.

* Fuel burning rates based on 140,000 Btu oil. ** Based on coal having 12,000 Btu per lb as fired.

Note 1—Standard base is 14 in. high. Bases of 20 and 30 in. height available for mechanical firing at additional cost.

Note 2—Boiler ratings do not include allowance for heating domestic water by indirect coils. When the hot water demand is added to the heating load for more than ten minutes in any hour, an allowance of 4 sq ft of steam radiation or 6.4 sq ft of water radiation must be added for each gallon of water heated.

Standard equipment—6 cleanout plugs, 3R1 to 3R11. 8 cleanout plugs, 3R12. Socket wrench with extra set of gaskets. Steel base complete with 8 x 14 in. covered opening. Flue and soot scrapers with handles. Spinner blades for 3R1 to 3R8 Oil or Gas boilers only.

Standard trim, steam—Water gage, two compression goge cocks, steam gage, pop safety valve.

Water—Combination altitude gage and thermometer only.

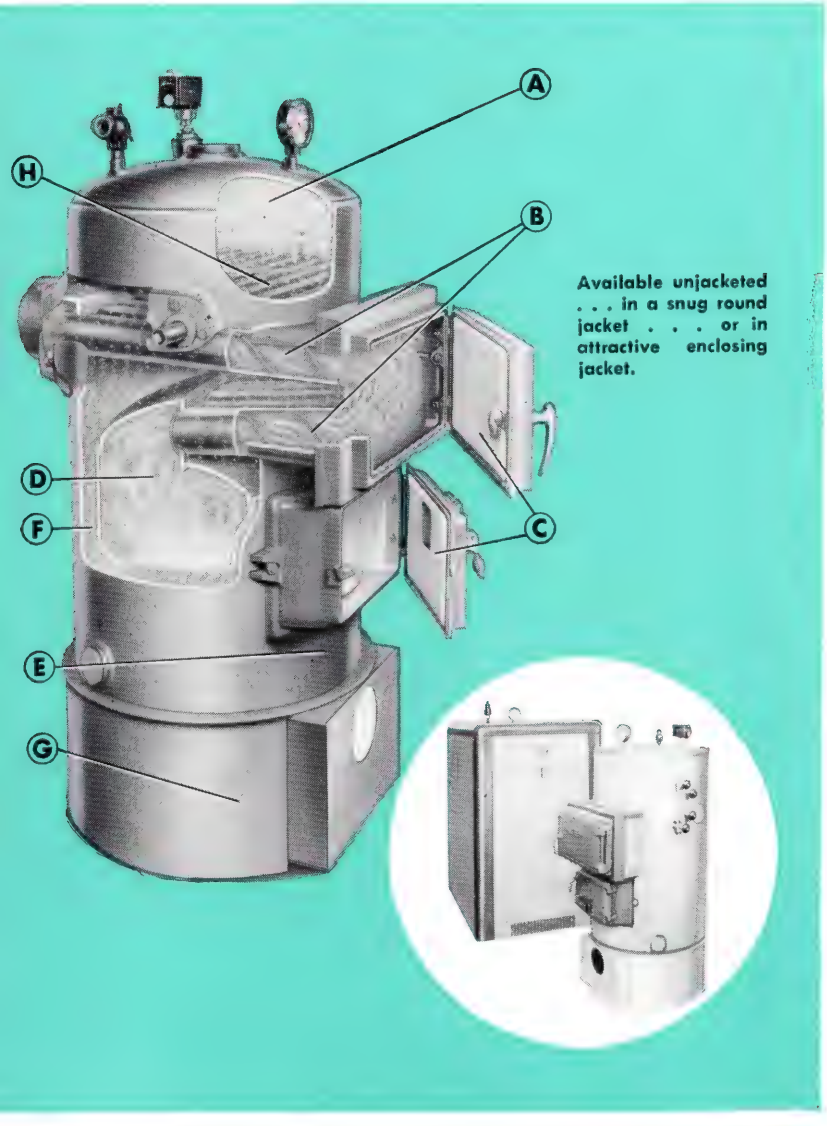
*150 lb American Standard Flange. Eight ¾ in. bolts, 9½ in. bolt circle.

KEWANEE®



Available unjacketed . . . in a snug round jacket . . . or in attractive enclosing jacket.

Round type "R"

4 sizes . . . 96,000 to 216,000 Btu
400 to 900 sq ft steam
640 to 1440 sq ft water

Higher comfort standards for homes . . . with modern designs featuring enlarged window areas and in ranch types, far more roof and wall areas . . . impose a tougher heating problem on the boiler. This problem is met completely by Kewanee Round "R."

Sturdily built of heavy steel plate it stays on the job for many extra years. Features unusual dependability . . . economy . . . with a capacity to handle large overloads.

A **Capacious steam space** holds a large reserve of steam for unusual demands . . . one reason Round "R" can be fired above its rated capacity and continue to operate with efficiency.

B **Two-pass tubes** provide longer travel for the hot gases retaining them in the boiler until all usable heat is transferred to the water. **Spinner Blades** swirl gases against tube walls assuring maximum heat transfer.

C **Well insulated sturdy cast iron doors.** Flue door and frame are precision ground and sealed with asbestos rope gasket for a permanent gas tight fit.

D **Large, high firebox** provides sufficient space for gases to mix with oxygen and burn completely.

E **Shell,** of extra heavy steel boiler plate, is everlastingly welded into one piece, ready to set on its base.

F **Wide, free waterways** assure rapid circulation, sweeping steam bubbles quickly and without commotion up to the unobstructed release area at the water line.

G **Heavy steel base** can "take it." With Round Jacket, base may be swung around to fire from front, rear, side or any angle.

H **Domestic hot water coil,** brazed in bronze fittings and mounted on steel plate with locknuts and rubber gaskets, provides ample hot water for kitchen, laundry and bath.

Specifications and data are shown for mechanically-fired boilers. For information regarding hand-fired coal types consult the nearest Kewanee representative.

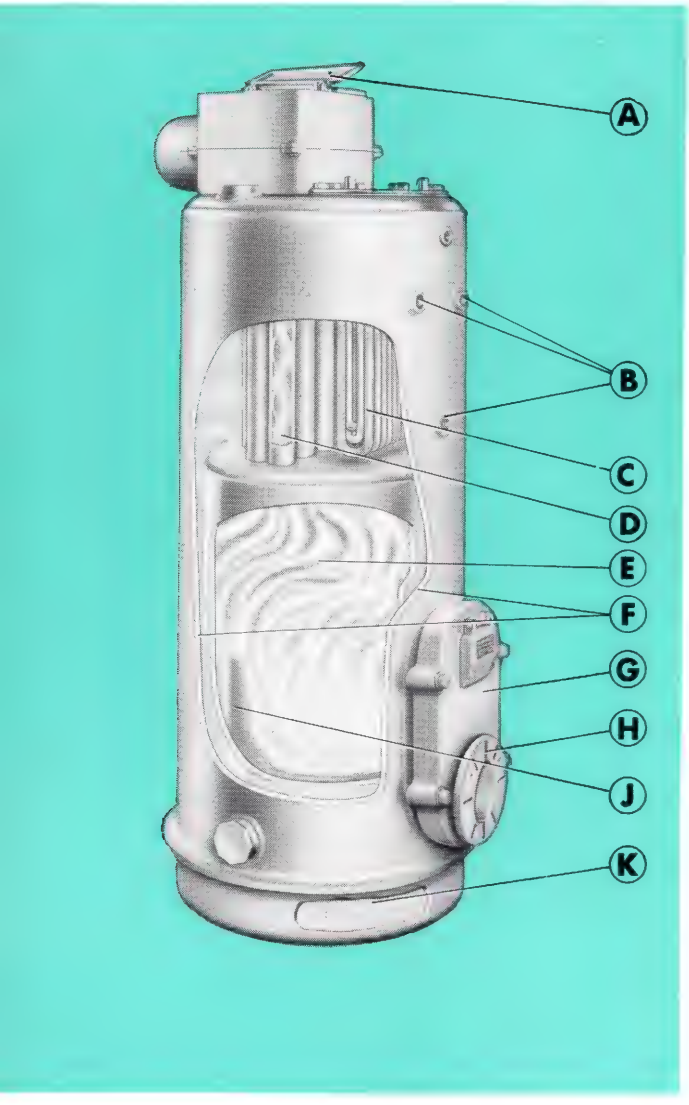
KEWANEE®



VT510 Cottage Boiler

. . . oil or gas
77,000 Btu . . . 510 sq ft water

The Cottage Boiler is Kewanee's answer to the long standing need for a *quality steel boiler* for small homes. It provides *completely automatic forced hot water heat* . . . with ample domestic hot water for kitchen, laundry and bath . . . at a price within the reach of modest budgets. In its attractive steel jacket it occupies a space only 23 x 23 in. Though rated at 77,000 Btu, it is capable of carrying 50% more than its rated capacity.

features

A **Hinged double cover** on smokehood provides easy access to tubes for cleaning.

B **Tappings** in boiler shell provide for all automatic controls.

C **Domestic hot water coil** made in one unit, either tankless or storage tank type, easily inserted any time through top head.

D **Vertical tubes with spinners** scrub hot flue gases against tube walls thus assuring greater heat transfer without choking the draft.

E **High firebox** permits thorough combustion of fuel and rapid heat transfer.

F **Heavy gage welded steel construction** hydrostatically tested at 150 lbs. for maximum water working pressure of 100 lbs.

G **Sturdy cast iron fire-cover plate** with free swinging puff-back safety swivel for observing flame. Refractory lined to prevent warping.

H **Universal flange** fits practically any flange mounted oil burner. Square mounting may be provided for gas burners.

J **Stainless steel combustion chamber** "soups-up" combustion of oil. Installed easily through firedoor opening.

K **Insulation refractory fill-in** keeps floor cool and boiler heat inside.

Standard equipment—Burner mounting flange; spinner blades in the heavy gage tubes. Flue scraper.

Standard trim—Combination altitude gage and thermometer; stainless steel combustion chamber for oil-firing supplied at extra cost.

VT510-U Cottage Boiler-Burner Unit

oil fired only

Now the very efficient Kewanee Cottage Boiler (described on opposite page) is available as a Boiler-Burner Unit complete with an *all-star cast of accessories.* Built, assembled, tested and substantially crated at the factory, this complete unit can be moved onto the job and installed with minimum time and labor.

The boiler and burner, all controls, pump, safety and relief valve, etc., are quality products . . . all having "won their spurs" on thousands of installations.

Standard equipment includes:

A **Air relief fitting** eliminates any accumulation of air in the boiler or system.

B **Water relief valve** is ASME rated to open at a pressure of 30 lb. . . . an important safety factor.

C **Draft control** equalizes variations in draft and saves fuel.

D **Stack control** a safety switch that shuts off burner in case of ignition or flame failure and prevents operation until manually set.

E **Theraltimeter** . . . a combination altitude, pressure and temperature gage.

F **Domestic hot water coil** for tankless operation raises the temperature of 180 gallons of water 100° per hour.

G **Blanket insulation** one inch thick conserves heat.

H **Circulating pump** is precision built with oil lubricated bearings and thermal overload equipment. Silent in operation.

J **Oil burner** operates smoothly and quietly while providing perfect combustion of the fuel.

K **High and low limit operating controls** operate the burner in accordance with the temperature of the boiler's water. A visible scale and external adjustment makes regulation easy.

L **Room thermostat** either line voltage or low voltage with relay furnished when specified.

Jacket: Attractive steel jacket in two-tone green enamel completely encloses the boiler, burner and all controls. It occupies a space of only 25½ x 38 inches and is less than 5 feet in height. The minimum of 12 inches needed between back of boiler and wall permits installation almost any place.

KEWANEE®

Tabasco . . . a direct-fired water heater

oil, gas or hand-fired coal

5 sizes . . . 165 to 700 gph, 50° rise

While many water heaters are rated on their ability to raise water temperature 25° per hour, Tabasco ratings are based on a rise of 50° . . . so they do twice the job.

Built of rugged steel plate, heavier than code requirements, and constructed for 100 lb working pressure (hydrostatic test pressure of 150 lb) Tabasco Water Heaters are amply strong to stand the high pressures of city water mains.

With most of its primary heating surface directly over the fire, Tabasco is a fast heater while being economical in its use of fuel.

All cast parts are unusually heavy. And if hand fired coal is used the furnace door is large enough so a regular scoop shovel can be used. As many thousands of installations prove, a Kewanee Tabasco truly "stands the gaff," even when roughly used.

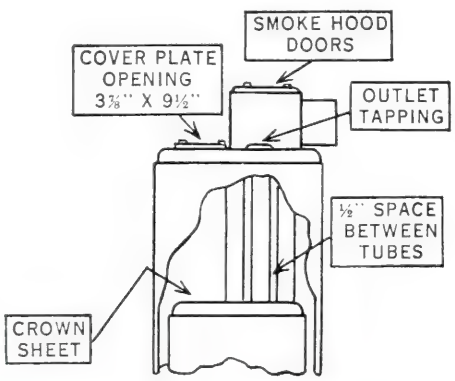
Cottage VT510-DW
. . . direct-fired water heater

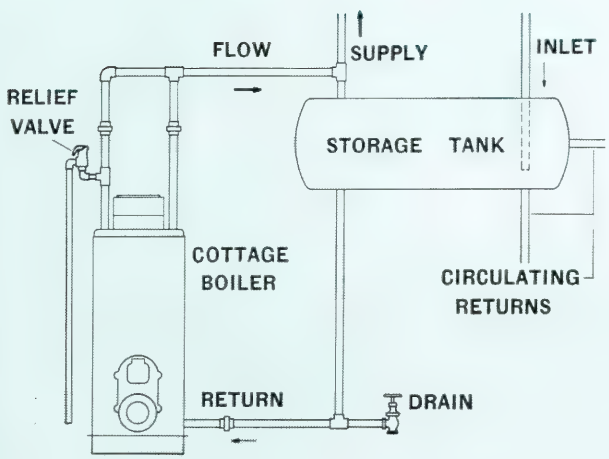
140 gallons . . . 100° rise

For an abundance of hot water *fast* the Kewanee Cottage Boiler used as a direct-fired water heater provides a most unusual performance. Teamed with any good oil or gas burner it operates with a surprising economy in the use of fuel, yet it requires very little floor space.

Enclosed in an attractive steel jacket it is only 23 x 23 in. and less than 5 ft high. Built according to ASME code, it is tested with 150 lb hydrostatic pressure for working pressures up to 100 lb.

Easy to clean: Simply remove the 8 bolts, remove the cover plate and tubes can be reached for scale removal . . . also the top of firebox. An important feature in localities where water conditions are adverse.





typical piping connections (diagram at left)

For most favorable circulating conditions storage tank should be placed as high above the heater as headroom permits.

Cold water supply should enter storage tank through pipe extending to within 6 in. of bottom.

Return circulating line between tank and heater should connect at bottom of tank opposite cold water inlet.

Hot water flow line should connect at either end or top of tank. Return may connect to the back of the heater or to any other of the bottom openings.

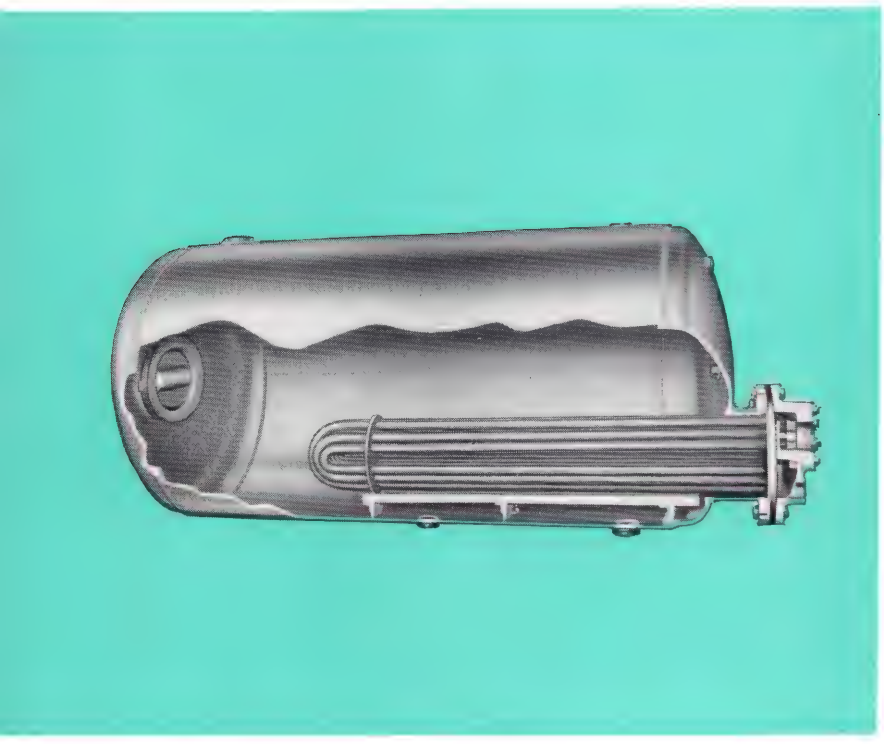
KEWANEE®



storage water heaters

. . . 50 to 6000 gph

Where varying quantities of hot water are used at irregular intervals . . . and exhaust or live steam is available . . . Kewanee Storage Water Heaters provide a very useful service. With heating coils capable of heating 50 to 6000 gallons of water per hour (raising temperatures from 40° up to 180°) and storage tanks of 95 to 2240 gallons capacity, water can be heated and accumulated, insuring an ample supply, at any time, without creating an overload on the boilers or other steam supply.

The heating element is constructed of heavy gage copper tubing bent into a U shape, which takes care of any expansion of the tubes in service. Tubes are securely rolled into the tube sheet and held in place by the support plates to prevent vibration and wear. Steam bonnets are of heavy design, accurately machined, and there are no internal gaskets or joint to leak.

The very wide range of capacities of tanks and heating coils makes it possible to fit almost any operating condition with one of these standard units.

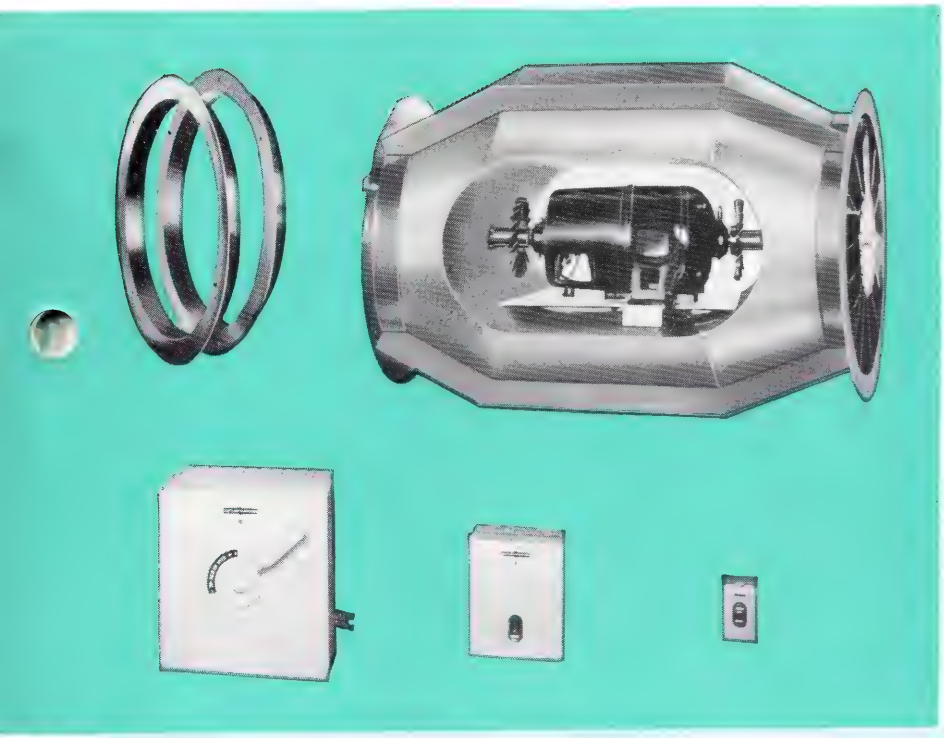
Shell openings ASME code over 125 lb swp and over 3 in. diameter are flanged nozzles.



fans for every size boiler

When you are up against a difficult stack problem, your Kewanee Boiler can be furnished with complete induced draft equipment. These units are designed to provide constant (although adjustable) predetermined draft for boilers, both high and low pressure, and will withstand flue gas temperatures up to 650° F. within maximum room temperature of 125° F.

Designed as a "straight through" unit, these induced draft fans are easily installed and can be mounted in any position as a flanged section of breeching or stack.

Not only are these units low in first cost and require minimum maintenance, but permit maximum boiler efficiency at all loads, regardless of weather conditions.

For further information and complete data on induced draft fans for Kewanee Boilers, consult your nearest Kewanee Sales Office.

Illustration at left shows (top) two-stage induced draft bifurcator with 3-phase variable-speed motor and companion flanges, (bottom) nine-step speed controller, magnetic starter and push-button station.

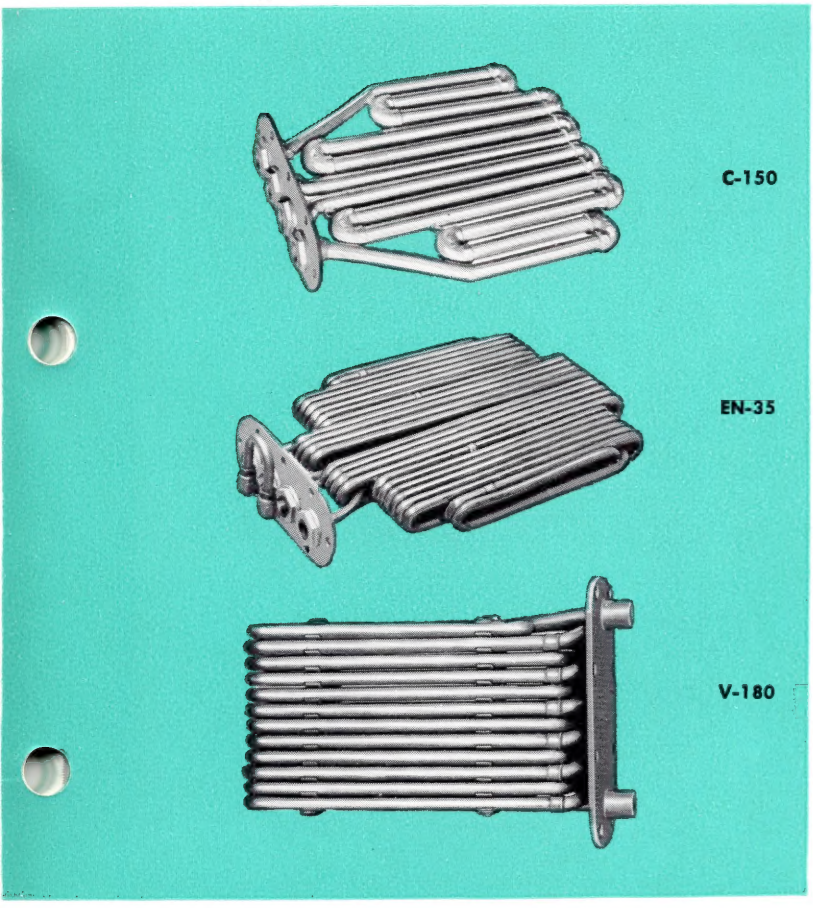
Information on coils for LM-800 boilers on application.
Any coil shorter than the maximum lengths listed above may be substituted in each boiler where less hot water capacity is required.
Coil inlet and outlet same size iron pipe tap, 1 in. on TON and 1¼ in. on QON instantaneous, also 1¼ in. on DR and 1 in. on SR storage tank coils.



indirect hot water heating coils for residential boilers

Kewanee boilers for home heating can be equipped with indirect water heating coils (storage tank or instantaneous type) either at the factory or after the boiler is installed and in use.

All are made with openings to accommodate the hot water coils and it is necessary to remove only the coil opening plate, insert the coil, and bolt it into place.

Kewanee coils for domestic hot water are substantially built for long, trouble-free use and efficient operation. The copper tubing is brazed into bronze fittings mounted on a steel mounting plate with locknuts and gasket. Coil ends are tapped to receive standard pipe thread.

specifications
boiler support brackets

For low pressure firebox and Type "C" boilers, the support brackets shall consist of two pairs of steel bearing plates, each with two gussets welded to the boiler at the bottom of the waterleg. Each gusset to have a ½ in. hole for wiring insulation to the boiler.

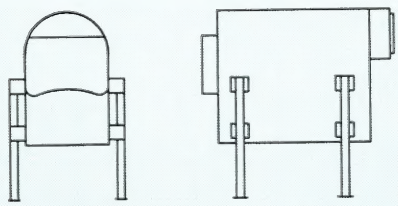
For high pressure firebox boilers, two pairs of forged steel welded bearing plate brackets drilled for secure fastening at bottom of the waterleg with stud bolts.

On high and low pressure firebox boilers, the barrel shall be supported by a cast iron "A" frame backstand grouted on masonry pier.

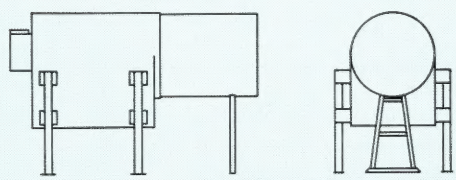
specifications
structural steel suspension

Suspension shall consist of four steel H-columns with bearing plates, one pair each side of boiler and eight pairs of forged steel brackets fastened to boiler safely and to provide lateral stability according to ASME construction code. Each H-column shall be securely bolted to two pairs of boiler brackets. On firebox boilers the barrel shall be supported by an "A" frame backstand of steel members and bracing with top saddle and bottom bearing plates welded into one unit.

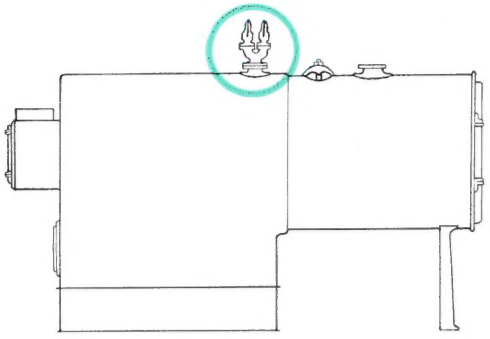
All column and backstand bearing plates have bolt holes for anchoring to foundation. (Anchor bolts not furnished by Kewanee.)



SUPPORTING COLUMNS · TYPE C



SUPPORTING COLUMNS & BACKSTAND



safety valves

boilers over 15 lb swp

Number and size varies with valve setting. All boilers having 500 sq ft or less of heating surface furnished with one valve. Boilers having more than 500 sq ft of heating surface furnished with two or more valves. Manufacturer reserves right to use separate outlets or yokes as conditions require.

boilers 15 lb swp
